## ENERGY AND CARBON POLICY

Climate protection and limited availability of fossil fuels is one of the key aspects of Tirana International Airport's Energy and Carbon Policy. Energy efficiency, energy saving and reduction of carbon emissions plays a major role in our development and business strategy.

Tirana International Airport has set up and is implementing and maintaining an Energy Management System orientated towards the ISO 50001:2018 and based on continuous improvement of energy efficiency and carbon reduction. Setting and reviewing energy and carbon reduction objectives and targets are part of the overall management system and the daily work.

Tirana International Airport will invest into new technologies, will systematically monitor and will promote energy-efficient purchasing of products and services.

The provision and availability of resources and information, and also the involvement of Management and employees, who are required to achieve these objectives, is another important aspect of our policy. Conformity with related Albanian energy and climate change legislation is the basis to achieve the targets set in our Energy and Carbon Management Plan.

Tirana International Airport will guide airport stakeholders towards control and reduction of energy consumption and carbon emissions.

This Energy and Carbon Policy is documented, communicated and published on Tirana International Airport's website. This Policy will be regularly reviewed and updated as necessary.
